

IN THE CLAIMS

1 Claims 43 and 45-62 are pending.

2 Claim 44 is canceled herein, and claims 1-42 were previously canceled.

3 Claims 43, 50-52, 58, and 61 have been amended.

4

5 1-42. **(Canceled)**.

6

7 43. **(Currently Amended)** A method comprising:

8 randomly retrieving a plurality of blocks of data from a computer-readable media,

9 wherein at least one block of data includes data not contained in a given content;

10 generating a digest value for each of the plurality of randomly retrieved blocks of
11 data;

12 comparing each of the digest values to a set of verification data; and

13 determining that the computer-readable media contains an original version of the
14 given content if the digest values match a subset of the verification data; and

15 allowing access to a functionally equivalent version of the given content, which is
16 smaller than the original version, if the digest values match a subset of the verification
17 data.

18

19 44. **(Canceled)**.

20

21 45. **(Previously Presented)** A method according to Claim 43, further
22 comprising allowing access to related material if the digest values match a subset of the
23 verification data.

1
2 46. **(Previously Presented)** A method according to Claim 43, wherein
3 generating the digest value for each of the plurality of randomly retrieved blocks of data
4 comprises calculating a cryptographic hash value.

5
6 47. **(Previously Presented)** A method according to Claim 43, wherein the
7 processes of randomly retrieving a plurality of blocks of data, generating digest values,
8 comparing each of the digest values and determining that the computer-readable media
9 contains an original version are performed when a watermark is embedded in the
10 functionally equivalent version of the given content.

11
12 48. **(Previously Presented)** A method according to Claim 43, further
13 comprising:

14 partitioning a trusted version of the first content into a plurality of verification
15 data blocks; and

16 establishing the plurality of verification data by calculating a cryptographic hash
17 value for each of the plurality of verification data blocks.

18
19 49. **(Previously Presented)** One or more computer-readable memories
20 containing a computer program that is executable by a processor to perform the method
21 recited in claim 43.

23
24 50. **(Currently Amended)** A method comprising:

25 receiving a request to access a given content;

1 calculating a digest value for each of a set of blocks of data randomly retrieved
2 from a computer-readable media, wherein at least one block of data includes data not
3 contained in the given content;

4 verifying whether the received plurality of blocks are from an original version of
5 the given content by comparing the calculated digest values to a set of associated
6 verification digest values; and

7 controlling access to a functionally equivalent version of the given content, which
8 is smaller than the original version, if the calculated digest values digests value match a
9 subset of the associated verification digest values.

10
11 51. **(Currently Amended)** The method according to Claim 50, wherein
12 controlling access to a functionally equivalent version of a given content comprises
13 playing a requested music file if the calculated digest values digests value match a subset
14 of the associated verification digest values.

15
16 52. **(Currently Amended)** The method according to Claim 50, wherein
17 controlling access to a functionally equivalent version of a given content comprises
18 launching a requested application program if the calculated digest values digests value
19 match a subset of the associated verification digest values.

20
21 53. **(Previously Presented)** The method according to Claim 50, wherein
22 controlling access to a functionally equivalent version of a given content comprises
23 preventing installation of a requested music file if any of the calculated digest values do
24 not match any associated digest value.

1
2 54. (Previously Presented) The method according to Claim 50, wherein the
3 set of associated verification digest values are stored with the original version of the
4 given content.

5
6 55. (Previously Presented) The method according to Claim 50, wherein the
7 set of associated verification digest values are available on an internet web site.

8
9 56. (Previously Presented) The method according to Claim 50, further
10 comprising verifying that the set of associated verification digest values come from a
11 known authority.

12
13 57. (Previously Presented) One or more computer-readable memories
14 containing a computer program that is executable by a processor to perform the method
15 recited in claim 50.

16
17 58. (Currently Amended) A verification system comprising:
18
19 a data reading device to read data from a computer-readable media; and
20
21 a verification module coupled to the data reading device, wherein the verification
22 module is adapted to receive a request to access a given content, to request a random set
23 of blocks of data from the computer-readable media that includes at least one block of
24 data that does not contain the given content, to verify whether the received plurality of
25 blocks are from an original version of the given content by comparing digest values of a
received set of blocks of data to a corresponding set of known valid digest values, and to

1 control access to a functionally equivalent version of the given content, which is smaller
2 than the original version, if the calculated digest values match a subset of the known valid
3 digest values.

4

5 59. (Previously Presented) A verification system as recited in Claim 58,
6 wherein the verification module is further adapted to control access to related material if
7 the calculated digest values match a subset of the known valid digest values.

8

9 60. (Previously Presented) A verification system as recited in Claim 58,
10 wherein the verification module is located in a handheld audio player containing the
11 functionally equivalent version of the given content and the data reading device is located
12 in a computer system coupled to the handheld audio player.

13

14 61. (Currently Amended) A verification system as recited in Claim 58,
15 wherein the verification module is located in a server containing the corresponding
16 set of known valid digest values and the data reading device is located in computer
17 system coupled to the server.

18

19

20 62. (Previously Presented) A verification system as recited in Claim 58,
21 wherein the verification module and the data reading device are coupled to one another
22 across the Internet.
